Anti-inflammatory, macrophage inhibitory activity, fibronectin; T-cell inhibitory activity, adherence, extracellular matrix; up-regulation; fas receptor expression; inflammation.	Synthetic.	WO9809985-A2.	12-MAR-1998.	03-SEP-1997; 97WO-IL000295.		20-NOV-1996; 96US-00753141. 28-WAY-1997; 97US-00864301.	(YEDA) YEDA RES & DEV CO LTD.	Eisenbachschwartz M, Beserman P, Hirschberg DL;	WPI; 1998-193550/17.	Anti-inflammatory peptides and derivatives - used for treating, e.g. arthritis, ulcerative colitis, auto-immune disease, allergy asthma, shock, HIV infection, transplant rejection or Alzheimer's disease.	Claim 7; Page 35; 42pp; English.	56171-248 represent anti-inflammatory tripeptides of the invention	y are derived from the formulae: xaa-ulu-Arg, Arg-ulu-aaa, Aaa-ru; , or Glu-arg-Xaa, where Xaa = any amino acid residue. Cyclic ivarives of the peptides also function as anti-inflammatory agent	pertides can be covalently linked to one another either directly ough a spacer. The peptides and their derivatives have macrophage	inhibitory and T-cell inhibitory activity and thus, anti-inflammatory activity. The peptides and compositions have anti-immune activity, 1.e inhibitory effects against a cellular and humoral immune response,

The peptide is useful for treating a disease state, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. This sequence represents a human targeting peptide selective for human organs, tissues or cell types
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ಡ
including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and T-cells to adhere to extracellular matrix components and fibronectin, as well as up-regulated fas receptor expression in T-cells. They can be used to inhibit unwanted immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New targeting peptides identified by phage display, useful for treating disease state, e.g. cancer, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial or viral infection or cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                              Targetting peptide selective for human organ, tissue or cell type #313.
                                                                                                                                                                   Gaps

```
The sequences given in AAA41636-57 represent the cores of internalisation signals which were used in the method of the invention for modulating receptor mediated transport of a ligand into a cell. These sequences are derived from the cytoplasmic tails of surface receptors. These amino acid internalisation signals have a tight turn structure. The introduction of one of these sequences into a receptor within a cell, modulates the transport of ligand into a cell having a surface receptor reactive with that ligand. This modulation can cause an increase or a decrease in endocytosis, depending on the choice of internalisation signal. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide(s) and analogues based on amyloid precursor protein - used for promoting neuronal growth in conditions involving damage to neurons or in treating Alzheimer's Disease etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

An antigenic conjugate, useful as a vaccine for AIDS, has the formula (SPNE)n-(OMPC), where SPNE is a selected principal neutralisation epitope of HIV, which is one of 16 specified polypeptides (including the present sequence) or their fragments containing at least 5 amino acids; OMPC is purifited outer membrane proteosome of Neisseria (pref. N. meninglitidis); and n is 1-200, indicating the number of SPNE moieties covalently linked to the OMPC. The conjugates may be substituted by anions, and conjugation may be via a bigeneric spacer. The SPNE polypeptides bind an HIV broadly neutralising monoclonal antibody (559 antibody) that binds gpl20 and also inhibits the binding of HIV to CD4. They were originally identified in the bitope polypeptides accessible to the antibody. The libraries were ALPHA and EPSILON described in AAR83295 and AAR83299 respectively. The sequences of these polypeptides were deduced from their corresponding DNA sequence.
                                                                                                                                                                                                ö
                            This sequence corresponds to AA 330-333 of amyloid precursor protein. This peptide, which partially overlaps the C-terminal side of thet acti sequence RERMS (AAR54661), acts to antagonize the activity of secreted APP (695 AA). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antigenic conjugate useful as vaccine for AIDS - comprising HIV principal neutralisation epitope covalently linked to outer membrane proteosome of Neisseria.

These peptides are inhibitors of the zinc-dependent endopeptidase EC.3.4.24-15 and so prevent degradation of e.g. somafoostatin, bradykinin, angiotensin, neurotensin, substance P, dynorphin etc. and may prevent maturation of ras oncoprotein. They are useful in treatment of pain, hypothermia, arterial hypothermia, cancer and Alzhaimer's disease. They are very selective for 24-15 with no significant action on other zinc endopeptidases such as 24-16, and are more stable, chemically, than phosphonamide peptide derivatives

These peptides are inhibitors of the zinc-dependent endopeptidase EC.3.4.24-15 and so prevent degradation of e.g. somatostatin, bradykinin, angiotensin, neurotensin, substance P, dynorphin etc. and may prevent maturation of ras oncoprotein. They are useful in treatment of pain, hypothermia, seterial hypertension, cancer and Alzheimer's disease. They are very selective for 24-15 with no significant action on other zinc endopeptidases such as 24-16, and are more stable, chemically, than phosphonamide peptide derivatives
                                                                                                                                                                                                                                                                                                                                                                          1. .2
/note= "Z-Phe-psi[PO2CH2]-Gly, where Z is benzyloxy-carbonyl and -psi[PO2CH2]- indicates replacement of the peptide linkage -CONH- between Phe and Gly by the group PO2CH2-"
                                                                                                 Zinc endopeptidase; EC.3.4.24-15; selective inhibitor; analgesic; pain; hypothermia; arterial hypertension; cancer; Alzheimer's disease; phosphinic acid; pseudopeptide linkage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide derivs. contg. phosphonic acid gp. replacing an amide bond are highly specific inhibitors of endo:peptidase 24-15, for treating hypothermia, hypertension, cancer, Alzheimer's disease etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

peptides AAW46520-53 contain protease binding sites. They are used to produce novel reagents whose fluorescence increases in the presence of produce novel reagents whose fluorescence increases in the presence of particular proteases. These fluorescent signal at a visible wavelength when they are digested by a protease. The fluorogenic indicators have the general formula: F1-C1-P-C2-F2 | (S1)n (S2)k where: P is a peptide containing a protease binding site, e.g. AAW46520-33. F1 and F2 are containing a protease binding site, e.g. AAW46520-33. F1 and F2 are contornation-determining regions that introduce a bend into the composition which positions the fluorophores adjacent to each other with a separation of less than 100 Angstrom. When n is 1, S1 is joined to the terminal alpha -amino group of C1 by a peptide bond, and when k is 1, S2 is joined to the terminal carboxy group of C2 by a peptide bond. The procease indicators are used for detecting protease activity in a biological sample. The sample is contacted with the indicator and any change in fluorescence is detected, an increase in fluorescence indicating protease activity
                                                                                                                                                                                                                                      Fluorogenic substrates for protease determination - having two closely spaced fluorophores flanking protease binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human immunodeficiency virus-1; HIV-1; protease; provirus; L-2 cell; mutation; Nef protein; immunogen; apoptosis; treatment; hybridisation; cell lysis; chemotherapeutic; toxin; HIV infection; MO/LAI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying DNA encoding inducible or suppressible cytochrome P450 - by screening for drugs which reduce the catabolism of retinoic acid, useful in cancer chemotherapy and the treatment of acne and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protease binding site; protease; protease indicator; fluorescent signal; detection; protease activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is a degenerate peptide from which the PCR primer used in the amplification process is derived. The PCR involves the inducible cytochrome P450 gene which produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. A form of cytochrome P450 is P450RAI which specifically metabolises a derivative of retinoic acid (RA). It is highly induced by RA in cell lines and tissues. This allows for the development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

the defective human immunodeficiency virus-1 (HIV-1) provirus in L-2 cells. They represent the portions of pol protease (prot.), vpr, env cells. They represent the portions of pol protease (prot.), vpr, env cells. They represent the portions of pol protease (prot.), vpr, env captured as compared to wild-type HIV-1 in LAI or MO/LAI cells. The invention relates to mutated to DNA, proteins or fragments of defective HIV-1 provirus in L-2 cell line. The mutations result in non-infections HIV-1 particles. Inactive, creducing or preventing are used as immunogens, particularly for truncated protein fragments are used as immunogens, particularly for cruncated protein fragments are used as immunogens, particularly for cubjects, specifically those with HIV-1 infection, both for prevention and treatment. Pragments of nef gene and fragments encoding specific and treatment. Pragments of nef gene and fragments encoding specific detection of mutated genes in (lysed) cells or body fluids, while the corresponding mutant proteins are detected in immunoassays using corresponding mutant proteins are detected in immunoassays using corresponding attached to a radiciscope, chemotherapeutic agent or toxin, can be used to reduce the severity of HIV infections. (Updated on 17-OCT-can be used to reduce the severity of HIV infections.
                                                                                                                                                                                                                                                                                                         New nucleic acid encoding mutant or truncated forms of human immune deficiency virus proteins - used to generate non-infectious particles useful as therapeutic or prophylactic immunogens, also for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences AAW87475 to AAW87463 represent mutant amino acid sequences
the defective human immunodeficiency virus-1 (HIV-1) provirus in 1.-?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1; Fig 1; 66pp; English

04-APR-1997;
       AAW87481 to AAW87486 represent human immunodeficiency virus-1 (HIV-1) caid sequences in Mo/LAI cells that were used for comparing the mutant amino caid sequences of the defective HIV provirus in L-2 cells. AAV1858 to AAV1858 represent the portions of pol protease (proc.), vpr. env (gpl20 and gp41), and nef gene regions that were mutated as compared to wild-type HIV-1 in LAI or MO/LAI cells. The invention relates to mutated DNA, proteins or fragments of defective HIV-1 provirus in L-2 cell line. The proteins result in non-infectious HIV-1 particles. Inactive, protease-containing at least one of Nef truncated protein fragments are used as immunogens, particularly for reducing or protein grapposes in HIV-1 sero-negative or -positive subjects, specifically those with HIV-1 sero-negative or -positive subjects, specifically those with HIV-1 infection, both for prevention and treatment. Fragments of nef gene and fragments encoding specific mutant of metated genes in (lysed) cells or body fluids, while the corresponding mutant proteins are detected in immunoassays using carticonally attached to a radioisotope, chemotherapeutic agent or toxin, can be used to reduce the severity of HIV infections. (Updated on 17-OCT-can be used to reduce the severity of HIV infections. (Updated on 17-OCT-
                                                                                                                                                                                                                                                                                              New nucleic acid encoding mutant or truncated forms of human immune deficiency virus proteins - used to generate non-infectious particles useful as therapeutic or prophylactic immunogens, also for diagnosis.

but which may be used with advantage for tolerisation by itself or in conjunction with other epitope sequences from the present invention. The present invention describes a polypeptide comprising a human myelin basic protein (PMBP) fragment including P89-101 of PMBP, excluding native hMBP. The term P89-101 is not defined but may be intended to mean amino acids 89-101 of hMBP. The polypeptide can be used for tolerising a mammalian host immune system comprising B and T cells to an immunogen of interest, wherein said immunogen is restricted by a transplantation antigen of said host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related disease, especially cancer and a wide range of neurodegenerative disorders [e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, Indianated by a locationis, a locationic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated protein 2 (MAP2), neurofilament-I, neurofilament-M, neurofilament-P, presentiin I, presentiin II, glial fibrillary acidic protein (GRAP), the cellular tumour antigen ps; Herell leukemia/lymphoma 2 (bcl-2) proto-oncogene, semaphorin III, high mobility group protein-C (HMGP-C) and neuroendocrine specific protein A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Myelin basic protein; immunity; immune response; neurological; T-cell; human; immunogen; B-cell; transplantation antigen; immunomodulator.
                                                                                                                                                                                                                                                                                                      Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

Gaps

.

The present sequence represents an AE101 analogue effector compound used in the present invention describes a mammalian invariant chain protein (Ii) key peptide of sequence LRWKLPKPEKVSKWR and modifications with the exclusion of peptide YRWLDFPEPKPVSKWR. MHC class II molecules are synthesised in the endoplasmic reticulum with their antigenic peptide sites blocked by the invariant chain protein (Ii). The products and method can be used for the modulation of an immune response for therapeutic or diagnostic purposes. The enhancement of immunity can be used in the treatment of e.g. malignant or allergic disease. The immunosuppression can be used for the treatment of autoimmune disease, e.g. rheumatoid arthritis, multiple sclerosis, diabetes mellitus, lupus erythematosus, and psoriasis or allograft rejection modulation of immune response, e.g. for treating malignant, allergic autoimmune disease or allograft rejection. Example 1; Page 27; 149pp; English.

GENERAL INFORMATION:

APPLICANT LUKING Ronald B.

TITLE OF INVENTION: No. 6557296-Infectious, Protease Defective HIV Particles and

TITLE OF INVENTION: Nucleic Acid Molecules Encoding Therefor

FILE REFERENCE: PIM 4867

CURRENT APPLICATION NUMBER: US/09/919,124

CURRENT FILING DATE: 2001-07-30

PRIOR APPLICATION NUMBER: 60/043,047

Sequence 23, Application US/09256237
Patent No. 6670147
GENERAL INFORMATION:
APPLICANT: Heidemann, Hans H.
Mueller, Rolf
Sedlacek, Hans-Harald
IIILE OF INVENTION: NUCLEIC ACID CONSTRUCT FOR EXPRESSING
ACTIVE SUBSTANTES WHICH CAN BE ACTIVATED BY PROTEASES, AND
PREPARATION AND USE
                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gapa

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ઠે 셤 pimeloyl-CoA synthase - Bacillus sphaericus (fragment)

```
thyrotropin-releasing hormone receptor, splice form 387 - rat (fragment)
C,Species: Rattus norvegicus (Norway rat)
C,Species: Rattus norvegicus (Norway rat)
C,Species: Rattus norvegicus (Norway rat)
C,Species: A55096
R;de la Pena, P.; Delgado, L.M.; del Camino, D.; Barros, F.
J. Balo. Chem. 267, 25703-23708, 1992
A,Title: Two isoforms of the thyrotropin-releasing hormone receptor generated by alternat A;Reference number: A45096
A,Faccession: A45096
A,Sccession: A5096
A,Status: preliminary; not compared with conceptual translation
A,Wolecule type: mRNA
A,Residues: 1-15 - DEL>
A,Facessione: CFP: NIDPARC:UPI0000170C44; GB:S51512; NID:g261982; PIDN:AAB24549.1; PID:gA;Reperimental source: GH3 anterior pituitary cells
A,Rote: sequence extracted from NCBI backbone (NCBIP:120927)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Octoin-tyrosine kinase (EC 2.7.1.112) kit - mouse (fragment)

The invention relates to a method of determining the angiogenic index of a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present

The invention relates to human PRO polypeptides and the polymucleotides encoding them. The polypeptides and polymucleotides are useful for treating and disgnoshing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, sjoyeren's syndrome, vasculitis, arcoidosis, sutoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016175) and the encoded proteins (ABB57137-ABR57072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed centry of (II) is useful in gene therapy techniques to restore normal certifying of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers; and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disponsites, forenises, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. Abg00010-Abg30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

The present invention relates to high throughput screening assays for agents capable of modulating the activity of ATP-binding cassette transporter I (ABCA), also called cholesterol efflux regulating protein (CERP)). The method comprises determining the activity of an ABCA1 polypeptide in the presence of an ABCA1-interacting protein (AIP) that polypeptide in the presence of an ABCA1-interacting protein (AIP) that modulators of ABCA1 biological activity, particularly for identifying agents that modulate cholesterol or phospholipid levels in an animal. The method is useful for treating disorders of IBCA method: sepecially for reducing elevated plasma phospholipid or cholesterol levels in a patient at risk of developing disorders such as cardiovascular in a patient at risk of developing disorders such as cardiovascular disease. (CDD), coronary artery disease (CAD), cerebrovascular disease, coronary restenosis, and peripheral vascular disease. The present sequence represents a human AIP polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying ABCA1 (cholesterol efflux regulating protein) modulators for modulating cholesterol or phospholipid levels in animals, by determining ABCA1 activity in the presence of an agent-contacted ABCA1-interacting

The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense contisense nucleic acid, (2) a host cell containing the vector; (3) an isolated contisense nucleic acid, (4) an antibody capable of specifically binding contisense nucleic acid, (4) an antibody capable of specifically binding cc antisense nucleic acid, (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibits cellular proliferation; (8) required for proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the gene compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling the extent compound; a activity; (11) a culture comprising strains in which the gene compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) determining the extent compound; activity; (11) a culture compound that inhibits the extent compound that inhibits the conficuence of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a
              identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                      72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antiinflammatory; antibacterial; immunostimulant; auditory; respiratory; gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media cear infection.
                                                                                                                                                                                                                                                                                                                            proliferation of an organism. The antisense nucleic acids are useful for

nucleic acid cited above or fragance between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the termin of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound with the and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus preventing a disease or infection where one or streptococcus media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coling regions from the genemic sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                : | :| |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: | |:: |:: | |:: |:: | |:: |:: | |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |:: |::
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9 LKKKAQYEANKVK-----LWGLNTEYDNLLFVINSIKQEIVNRVQNPRDERGPNM-- 58
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              at ftp.wipo.int/pub/published_pct_sequences.
